AIR CONDITIONING SYSTEM

PRECAUTION

NOTICE:
When the cable is disconnected from the negative (-) battery terminal, initialize the following system(s) after the cable is reconnected.

<table>
<thead>
<tr>
<th>System name</th>
<th>See procedure</th>
</tr>

<tbody>
<tr>
<td>METER / GAUGE SYSTEM</td>
<td>See page ME-10</td>
</tr>
</tbody>
</table>

1. Before performing electronic work, disconnect the cable from the negative (-) battery terminal in order to prevent it from shorting and burning out.
2. Before disconnecting and reconnecting the battery cable, turn the ignition switch OFF and the headlight dimmer switch OFF. Then loosen the terminal nut completely. Do not damage the cable or terminal.
3. When the battery cable is disconnected, the clock and radio settings and stored DTCs are erased. Therefore, before disconnecting the battery cable, make a note of them.

1. **CONNECT THE BATTERY NEGATIVE TERMINAL TO THE CABLE AND RUN THE ENGINE AT NO LESS THAN 2,000 RPM FOR 2 MINUTE**
   NOTICE:
   If the engine exceeds 2,000 rpm, the clutch is automatically disengaged by the compressor protection control system.

2. **DO NOT HANDLE REFRIGERANT IN ENCLOSED AREAS OR NEAR OPEN FLAMES**

3. **ALWAYS WEAR EYE PROTECTION**

4. **BE CAREFUL NOT TO GET LIQUID REFRIGERANT IN YOUR EYES OR ON YOUR SKIN**
   If liquid refrigerant gets in your eyes or on your skin:
   (a) Wash the area with lots of cold water.
   **CAUTION:**
   Do not rub your eyes or skin.
   (b) Apply clean petroleum jelly to the skin.
   (c) Go immediately to a hospital or a physician for professional treatment.

5. **NEVER HEAT CONTAINER OR EXPOSE THE CONTAINER TO OPEN FLAME**

6. **BE CAREFUL NOT TO DROP CONTAINER OR APPLY ANY PHYSICAL SHOCKS TO IT**
7. **DO NOT OPERATE COMPRESSOR WITHOUT ENOUGH REFRIGERANT IN REFRIGERANT SYSTEM**
   If there is not enough refrigerant in the refrigerant system, oil lubrication will be insufficient and compressor burnout may occur. Necessary care should be taken to avoid this.

8. **DO NOT OPEN HIGH PRESSURE MANIFOLD VALVE WHILE COMPRESSOR IS OPERATING**
   Open and close only the low pressure valve. If the high pressure valve is open, refrigerant flows in the reverse direction. This could cause the charging cylinder to rupture.

9. **BE CAREFUL NOT TO OVERCHARGE SYSTEM WITH REFRIGERANT**
   If refrigerant is overcharged, it causes problems such as insufficient cooling, poor fuel economy, engine overheating, etc.

10. **DO NOT OPERATE ENGINE AND COMPRESSOR WITH NO REFRIGERANT**
    **CAUTION:**
    Doing so may damage the inside of the compressor because the compressor parts always move regardless of whether the A/C system is turned on or off.

11. **SUPPLEMENTAL RESTRAINT SYSTEM (SRS)**
    (a) This vehicle is equipped with an SRS (Supplemental Restraint System) such as the driver, front passenger, side, and curtain shield air bags. Failure to carry out service operation in the correct sequence could cause the SRS to unexpectedly deploy during servicing, possibly leading to a serious accident. Before servicing (including removal or installation of parts, inspection or replacement), be sure to read the precautionary notices (see page RS-1).

12. **GENERAL PRECAUTION**
    (a) While using the battery during inspection, do not bring the positive and negative tester probes too close to each other as a short circuit may occur.

PROBLEM SYMPTOMS TABLE

HINT:
• Use the table below to help determine the cause of the problem symptom. The potential causes of the symptoms are listed in order of probability in the "Suspected Area" column of the table. Check each symptom by checking the suspected areas in the order they are listed. Replace parts as necessary.
• Inspect the fuses and relays related to this system before inspecting the suspected areas below.
• If the malfunction still exists even after checking and confirming that all the circuits are normal, replace the A/C amplifier.

## ON-VEHICLE INSPECTION

1. **CHECK REFRIGERANT PRESSURE USING MANIFOLD GAUGE SET**
   
   (a) This is a method to identify trouble areas by using a manifold gauge set. Read the manifold gauge pressure under the following conditions.

   **Test conditions:**
   - Engine warm.
   - All doors fully open.
   - A/C switch ON.
   - Blower speed control switch at HI.
   - Engine running at 1,500 rpm.
   - Air inlet mode damper set at recirculation.
   - Temperature control lever in MAX. COLD position.
   - Air temperature at air inlet 30 to 35°C (86 to 95°F).

   (1) When the refrigerant volume is correct, the gauge reading indicates as follows:

      **Low pressure side:**
      - 0.15 to 0.25 MPa (1.5 to 2.5 kgf/cm²)

      **High pressure side:**
      - 1.37 to 1.57 MPa (14 to 16 kgf/cm²)

      **HINT:**
      Pressure varies in accordance with certain conditions (outside air temperature, sunlight and wind).

If the idling speed is not as specified, check the idle control system.
REPLACEMENT

NOTICE:
When recharging refrigerant, collect together all the refrigerant remaining in the cycle, then recharge and seal the refrigerant as described below. (Do not overcharge.)

1. DISCHARGE REFRIGERANT FROM REFRIGERATION SYSTEM
   (a) Start up the engine.
   (b) Switch A/C ON.
   (c) Turn the blower switch to ON.
   (d) Operate the cooler compressor with an engine speed of approximately 1,000 rpm for 5 to 6 minutes to circulate the refrigerant and collect the remaining compressor oil from each component, in the cooler compressor.
   (e) Stop the engine.
   (f) Remove the caps from the service valves on the refrigerant line.
   (g) Connect the Freon collection/recycling device to discharge the refrigerant gas remaining in the refrigeration system.

   NOTICE:
   Use the Freon collection/recycling device in accordance with the manufacturer's instruction manual.

2. CHARGE REFRIGERANT
   SST 07110-58060 (07117-58080, 07117-58090, 07117-78050, 07117-88060, 07117-88070, 07117-88080)
NOTICE:
Charge refrigerant in accordance with equipment manual.
(a) Perform vacuum purging using a vacuum pump.
(b) Charge refrigerant HFC-134a (R134a).

Standard:
570 to 630 g (20.11 to 22.22 oz.)
NOTICE:
Do not start the engine before charging it with refrigerant as the cooler compressor doesn’t work properly without sufficient refrigerant. This could cause the compressor to overheat.

HINT:
- The relationship between the refrigerant charge amount and the pressure is as follows.

<table>
<thead>
<tr>
<th>Refrigerant charge amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>High Pressure</td>
</tr>
<tr>
<td>Low charge</td>
</tr>
<tr>
<td>Correct amount</td>
</tr>
<tr>
<td>High charge</td>
</tr>
</tbody>
</table>

- High Charge Range:
  If the refrigerant is overcharged, the pressure rises on the high-pressure side. High-pressure cut off frequently occurs. This causes insufficient cooling performance and also insufficient compressor lubrication.

- Low Charge Range:
  Shortage of refrigerant causes insufficient cooling performance and low circulation of refrigerant oil, which shortens the compressor life. Operation with insufficient coolant raises refrigerant temperature and causes heat deterioration of the rubber seals and hoses. Cracking and thus refrigerant leakage may occur.

1. Install the caps onto the service valves on the refrigerant line.

3. WARM UP ENGINE
NOTICE:
Warm up the engine at less than 2,000 rpm for 2 minute or more after charging it with refrigerant.

4. CHECK FOR REFRIGERANT LEAKAGE
(a) After recharging the refrigerant gas, check for refrigerant gas leakage using a halogen leak detector.
(b) Perform the operation as follows:
   • Stop the engine.
   • Secure good ventilation (the halogen leak detector may react to volatile gases other than refrigerant, such as evaporated gasoline or exhaust gas).
   • Repeat the test 2 or 3 times.
   • Make sure that some refrigerant remains in the refrigeration system. When the compressor is off: approximately 392 to 588 kPa (4 to 6 kgf*cm², 57 to 85 psi)
   HINT:
   It is impossible for the above pressure to be maintained if there is leakage.

(c) Using the halogen leak detector, check the refrigerant line, especially at the connection points, for leakage.

(d) Bring the halogen leak detector close to the drain hose before performing the test. 
   HINT:
   • After the blower motor has stopped, leave the cooling unit for at least 15 minutes.
   • Place the halogen leak detector sensor under the drain hose.
   • When bringing the halogen leak detector close to the drain hose, make sure that the halogen leak detector does not react to the volatile gases. If such a reaction is unavoidable, the vehicle must be lifted up.

(e) If no gas leakage is detected from the drain hose, remove the blower motor from the cooling unit. Insert the halogen leak detector sensor into the unit and perform the test.

(f) Disconnect the pressure switch connector and leave it for approximately 20 minutes. Bring the halogen leak detector close to the pressure switch and perform the test.

   SST 09960-10010 (09962-01000, 09963-00500)
   Torque: 18 N*m (184 kgf*cm, 13 ft.*lbf)
   NOTICE:
   Make sure that there is no foreign matter or oil on the compressor shaft, bolt, and clutch hub.
3. **INSPECT MAGNET CLUTCH CLEARANCE**
   (a) Clamp the cooler compressor in a vise.
   (b) Set the dial indicator to the magnet clutch hub.
   (c) Connect the battery positive lead to terminal 3 (MG+) of the magnet clutch connector and the negative lead to the earth wire. Turn the magnet clutch on and off and measure the clearance.
   **Standard clearance:**
   0.35 to 0.60 mm (0.014 to 0.024 in.)
   If the measured value is not within the standard clearance, remove the magnet clutch hub and adjust the clearance using compressor spacer to obtain the standard clearance.
   **Compressor spacer thickness:**
   0.1 mm (0.004 in.)
   0.3 mm (0.012 in.)
   0.5 mm (0.020 in.)
   **NOTICE:**
   Adjustment should be performed with 3 or less magnet clutch washers.
   (d) Remove the cooler compressor from the vise.

**INSTALLATION**

1. **ADJUST COMPRESSOR OIL**
   (a) When replacing the compressor with a new one, gradually discharge the refrigerant gas from the service valve. Then drain the following amount of oil from the new compressor before installation, so that the amount of oil contained in it is the same as that in the compressor to be replaced.
   **HINT:**
   New compressors are filled with sufficient oil for the whole cycle. Therefore, it is necessary to drain residual oil from the condenser and cooling unit.
   **Standard:**
   
   \[
   \text{(The amount of oil inside a new compressor: 120 (+15) cc (4.1 (+0.51) fl.oz.))} - \text{(The amount of oil remaining in the removed compressor)} = \text{The amount of oil to be removed when replacing the compressor}
   \]
   **NOTICE:**
   • When checking the compressor oil level, observe the precautions for cooler removal/installation.
   • If a new compressor is installed without removing the amount of oil remaining in the pipes of the vehicle, the amount of oil becomes too large. This prevents heat exchange in the refrigerant cycle and causes refrigeration failure.
   • If the amount of oil remaining in the removed compressor is too small, check for oil leakage.
   • Use ND-OIL8 compressor oil.
2. INSTALL COOLER COMPRESSOR ASSEMBLY
   (a) Install the compressor with the 4 bolts.

ON-VEHICLE INSPECTION

1. INSPECT PRESSURE SWITCH

HINT:
- The pressure switch is installed onto the air conditioning pipe on the high pressure side.
- The switch detects drops in refrigerant pressure, such as from refrigerant leakage, and turns the magnet clutch off (*1) to prevent damage to the compressor.
- The switch detects abnormally high pressure in the air conditioning cycle and turns the magnet clutch off (*1) to prevent damage to parts of the air conditioning cycle.

(*1): The ECM turns the magnet clutch on or off upon receiving the signal from the pressure switch.

- As the pressure switch operates when there is a malfunction with the refrigerant pressure, its function cannot be inspected on-vehicle. Follow the procedures below to inspect it.

(a) Inspect the refrigerant pressure in the air conditioning cycle.

(b) Read the manifold gauge pressure when the conditions below are established. (*2)

Test conditions:
- Engine running at 1,500 rpm
- Blower speed control knob in HI position
- Temperature control knob in COOL position
- Air conditioning switch ON
- Recirculation mode
- Doors fully open

Standard:
Pressure on high pressure side:
1.37 to 1.57 MPa (13.9 to 16.0 kgf/cm², 198 to 228 psi)

HINT:
- If the refrigerant pressure is not within the standard range, inspect and repair the air conditioning cycle.
  (See Page AC-12)

- Proceed to step (*2) if the refrigerant pressure is within the specified range.

- If the refrigerant pressure is below 196 KPa (2.0 kgf/cm², 28 psi), the refrigerant amount in the air conditioning cycle may have decreased significantly for reasons such as a gas leakage.
(c) Check the air conditioning operation.
   (1) Disconnect the pressure switch connector.
   (2) Connect terminals 1 and 2 of the pressure switch connector on the vehicle wire harness side using a service wire.
   (3) Start the engine.
   (4) Turn the air conditioning switch on and check that the magnet clutch is turned on.
   (5) Check that the magnet clutch is turned off when disconnecting terminals 1 and 2 (those connected in the prior step).

   **Standard:**
   - Terminals 1 and 2 connected: Magnet clutch is ON
   - Terminals 1 and 2 disconnected: Magnet clutch is OFF

   Replace the pressure switch if the magnet clutch operates normally.
   Inspect and repair the wire harness between the pressure switch and the ECM.
